13. ABSTRACT (Maximum 200 words) The sound attenuation of the HGU-84/P Rotary-Wing Helmet System with Oregon Aero earcup replacement products was evaluated in accordance with ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear procedures. The differences in insertion losses between the various helmet modifications were generally quite small and unlikely to have an effect on operational considerations, especially if double hearing protection in the form of earplugs, the Communications Earplug (CEP), or Attenuating Custom Communications Earphone System for Aircrew (ACCES for Aircrew) is employed. The insertion loss of the helmet with the Oregon Aero HushKit earcup replacement foam was significantly poorer than the standard helmet system. Insertion losses with the SoftSeal (replacement earcup seal) with HushKit and the SoftSeal/HushKit Combo (soft replacement earcup) were statistically significantly greater than the standard helmet configuration at some frequencies, although the differences were marginal at the low frequencies at which rotary-wing noise hazards are the greatest. Caution is urged when considering the use of the SoftSeal or SoftSeal/HushKit Combo since, at the time of this writing, neither of these earcup replacement products has been evaluated for helmet retention or blunt impact protection in case of an aircraft mishap.

Introduction

The Gentex HGU-84/P Rotary Wing Helmet System (RWHS) (Figure 1) is designed to provide impact protection and noise attenuation to U.S. Navy rotary-wing aircraft crewmembers. It has replaced the 1980's-vintage SPH-3C flight helmet and is used by most U.S. Navy rotary-wing aircrew.

Figure 1. Gentex HGU-84/P Rotary Wing Helmet System.

Oregon Aero, a manufacturer of replacement components for civilian and military vehicles and personal items such as helmets and headsets, has developed and is marketing several earcup replacement products for use in the HGU-84/P RWHS. These products include replacement earcup foam (HushKit™), replacement earcup seals (SoftSeal™) and replacement earcups (SoftSeal/HushKit Combo™) designed for use in a number of different helmet systems (see Figure 3). This report describes the insertion loss (noise attenuation) provided by each of these earcup replacement products when used with the HGU-84/P RWHS.

BEST AVAILABLE COPY

Method

Testing was performed in accordance with (IAW) the American National Standard Microphone-in-Real-Ear and Acoustic Test Fixture Methods for the Measurement of Insertion Loss of Circumaural Hearing Protection Devices (ANSI S12.42-1995 [R1999]), Microphone-in-Real-Ear (MIRE) method. Using miniature microphones positioned at the entrance to the ear canals, noise levels were measured with and without the HGU-84/P RWHS in place. The difference in the two measurements provided a physical measure of the performance (insertion loss) of the device. Evaluations were made with the HGU-84/P RWHS worn using normal-fitting procedures and with the helmet adjusted to a relatively tight fit; tighter, in fact, than could be worn comfortably under normal circumstances. Initial evaluations were made with the HGU-84/P RWHS as configured by the manufacturer with the HushKit™ replacement earcup foam, with the SoftSeal™ replacement earcup seal with HushKit™, and with the SoftSeal/HushKit Combo™, a soft replacement earcup with Oregon Aero foam earcup liner. The second fitting procedure tested, in addition to the standard and three replacement configurations above, the SoftSeal™ replacement earcup seal without HushKit™ replacement earcup foam and a triangular soft replacement earcup similar to the SoftSeal/HushKit Combo™.

Subjects

The U.S. Army Aeromedical Research Laboratory recruited twenty volunteer subjects (18 male, 2 female) from tenant activities located at the U.S. Army Aviation Center, Fort Rucker, Alabama. The purpose of the study was explained to each subject. Each subject read and signed an informed consent form (Appendix A) and then completed a questionnaire regarding his/her hearing health (Appendix B). An otoscopic examination was performed and audiograms were collected on each subject before MIRE testing. At any time during this preliminary process, if a subject failed to qualify for ANSI S12.42-1995 (R1999) MIRE testing, he/she was released. No subjects failed to qualify for the study. Although subjects were permitted to withdraw from the study at any time, no subjects chose to withdraw from the study.

Devices tested

The earcup parts for the standard HGU-84/P RWHS are displayed in Figure 2. The earcup configurations with the HushKit™, SoftSeal™, and SoftSeal/HushKit™ Combo are displayed in Figure 3. To conserve test assets, four HGU-84/P RWHS units were acquired, sizes M, L, XL, and XL (wide). The earcups were removed and sets of replacement earcups were configured with HushKit™ and standard earcup seal or with the SoftSeal™ and HushKit™. A fourth configuration with the SoftSeal/HushKit Combo™ (Figure 3c) also was prepared. As noted above, the SoftSeal™ without HushKit™ and a custom SoftSeal/HushKit Combo™ with large triangular earcups also were tested using tight-fitting helmets. The standard speaker (earphone) used in the HGU-84/P RWHS was included in each configuration.

Upon completion of the informed-consent procedure and initial audiometric evaluation (see above), the subject selected the unmodified helmet that provided the best fit with regard to

BEST AVAILABLE COPY

hearing protection and comfort. Following helmet selection, one of the four earcup configurations was installed into the HGU-84/P RWHS. The fitting of the helmet for all conditions was performed by personnel trained by USAARL Aviation Life Support Equipment (ALSE) specialists.

Figure 2. Earcup, earcup seal, insert foam, and speaker (earphone) found in the Gentex HGU-84/P Rotary Wing Helmet System.

Equipment

The MIRE test procedure utilized two Knowles Model 1832 electret microphones, two QSC Audio PLX 3402 power amplifiers, three Altec Model 612C speakers, and a personal computer running Microsoft Windows™ 2000 with National Instruments PCI-4451 Dynamic Signal Acquisition and Generation board (part number 777534-01) and National Instruments LabVIEW™ software package installed. The sound field created by the described system satisfied the stimulus conditions mandated by ANSI S12.42-1995 (R1999). Control of the test procedure was performed by the Windows™-based computer system running custom LabVIEW software developed at USAARL. The test system played broad-band white noise through one channel of the PCI-4451 Dynamic Signal Acquisition and Generation board. Ten seconds of sound were recorded from the two electret microphones through the two analog input channels of the PCI-4451 board. The LabVIEW software analyzed the input noise using the ANSI third-octave band tools available within the National Instruments Sound and Vibration Analysis Toolset and saved the results on disk for later analysis. The data acquisition system was calibrated daily with an acoustic reference signal produced by a Brüel & Kjær (B&K) Type 4228 pistonphone to provide sound pressure levels referenced to 20 micropascals (μPa), input through a B&K Type 4192 ½-inch microphone, coupled to a B&K Type 2669 preamplifier powered and conditioned by a B&K NEXUS Type 2690 conditioning amplifier.

Procedure

At the start of a test session, each subject was fitted with silicone moldable earplugs (Flents Products, Silaflex™ No. 901) which served both as a hearing protector and a convenient medium for mounting the microphone. The subject was then seated in a hard-walled (reverberant) sound room. A non-directional sound field of wideband noise at approximately 105 dBA sound pressure level (SPL) was presented and unoccluded reference data were collected. To obtain these data, the noise signal was measured by the microphones in the subject's ears, the LabVIEW software performed the two-channel third-octave band analysis, and the results were stored by the computer for later analysis. Twenty-five third-octave bands with center frequencies from 63 Hz to 16,000 Hz were used. The sound field was then turned off and the subject donned the HGU-84/P RWHS with the Oregon Aero earcup replacement products installed. The sound field again was turned on and the noise signal was measured, analyzed, and stored in a like manner. The noise was measured, analyzed, and results stored after the subject doffed and donned the helmet two additional times, thus providing three measures of unoccluded and three measures of occluded noise levels for each subject. The algebraic difference between the mean of the three open and three occluded measurements for each one-third-octave band was defined as the insertion loss of the device IAW ANSI S12.42-1995 (R1999).

The total noise exposure for each subject was approximately 6 minutes for the entire experiment. For the unprotected ear, Department of Defense (DOD) Instruction 6055.12, "Hearing Conservation," limits allowable exposure time for a single 24-hour period for 105 dBA SPL (e.g., A-weighted SPL) to 32 minutes. The moldable earplug used in the measurement extended the maximum allowable exposure time to more than 16 hours. Thus, the subject's hearing was not considered at risk from the noise exposures encountered during this experiment.

A reference device (ANSI S12.42-1995, Paragraph 8.1.5) consisting of a string suspended from the test booth ceiling down to a level approximately equal to the elevation of a subject's nose was used to maintain the subject's head at the stimulus reference point, the point where stimulus calibration was performed. During testing, subjects were observed over a closed-circuit television system.

Statistical analyses were performed using STATISTICA® Release 6.1 from StatSoft®, Inc. Post-hoc analyses were performed using the Duncan multiple range test*. The probability of a Type I error was set at 0.05 for all analyses.

Results

The individual and summary results for all evaluations are reported in Appendices C and D. For each evaluation, three-way repeated-measures analyses of variance with repeated measures on all factors (Earcup Configuration \times Ear \times Frequency) were performed on the mean insertion losses for the standard HGU-84/P RWHS configuration and the HGU-84/P RWHS with Oregon Aero earcup replacement products installed. Analysis of variance summary tables are presented in Appendix E. Post-hoc analyses were performed using the Duncan multiple range test and results of the pair-wise multiple contrasts also are presented in Appendix E.

The insertion losses for normal fitting procedures (top two panels), tight fitting procedures (center panels), and combined ears (lower two panels) of the HGU-84/P RWHS worn with the Oregon Aero HushKit™, SoftSeal™ and HushKit™, and SoftSeal/HushKit Combo™ are illustrated in Figures 4, 5, and 6, respectively. The top panels for each of these figures show the mean insertion losses for the left and right ears of a normal fitting helmet. Likewise, the middle panels show the mean insertion losses for the left and right ears using a tight-fitting helmet procedure. The bottom left figure shows the insertion loss for normal-fitting helmets, averaging the left and right ears, and the bottom right figure shows the two-ear average results for tight-fitting helmets. In each of these three figures (as well as the subsequent two figures), error bars represent one standard error of the mean. Likewise the small vertical bars in the lower portion of each panel represent statistically significant post-hoc comparisons. The tight-fitting procedure routinely left red welts on the side of the test subject's head and was judged uncomfortable by the subjects. We conclude that it is unlikely that any aviator would wear a helmet in this fashion. Therefore, the data from normal fitting procedures are emphasized in this report. That is, while the Oregon Aero earcup replacement products may provide greater insertion losses when worn under tight-fitting helmets, it is unlikely that aircrew will actually wear helmets in this way, and these results are provided for informational purposes only.

* The Duncan's multiple-range test was used for post-hoc comparisons because only a limited set of comparisons, those between real-ear attenuation at threshold at the same test frequencies, were of interest in these analyses (Keppel, 1973).

There were statistically significant main effects of frequency in all analyses, which is expected based on our knowledge of the frequency-specific noise attenuation of hearing protectors in general and the HGU-84/P RWHS in particular. Of particular interest were the results of the multiple contrasts which gave definition to the mean insertion-loss differences displayed in each of the figures.

Results of our analyses demonstrated that helmets equipped with the HushKit™ foam product had lower mean insertion loss values (i.e., less noise attenuation and hearing protection) than helmets equipped with the standard foam. The Oregon Aero SoftSeal™ replacement earcup seal with the HushKit™ replacement foam provides some improvement in insertion loss, but most of the improvement is in the third-octave bands centered at from 2.0 to 8.0 kHz. The Oregon Aero SoftSeal/HushKit Combo™ provided some improved insertion loss in the lower frequencies over that provided by the standard helmet, as well as some higher insertion loss in the mid-frequency region (from 1.0 to 8.0 kHz).

Figure 7 displays the mean insertion losses for the standard tight-fit HGU-84/P RWHS and the Oregon Aero SoftSeal™ and HushKit™ (top) and with the SoftSeal™ alone. The top two panels of Figure 7 duplicate the center two panels in Figure 5. The center two panels illustrate the mean insertion loss results for the HGU-84/P RWHS fitted with Oregon Aero SoftSeal™ replacement earcup cushions, using the standard earcup foam insert. The bottom two panels illustrate the results when both ears were averaged for the HGU-84/P RWHS with SoftSeal™ and HushKit™ (bottom left) and the HGU-84/P RWHS with SoftSeal™ with standard foam (bottom right). The deletion of the HushKit™ from the SoftSeal™ with HushKit™ configuration removed the small insertion loss improvement that the SoftSeal™ and HushKit™ combination had over the standard HGU-84/P RWHS. Note that these data were collected using tight-fitting helmet fitting procedures and may not be representative of the insertion losses using normal helmet fitting procedures.

Figure 8 displays the mean insertion losses for the standard tight-fit HGU-84/P RWHS and the RWHS fit with the Oregon Aero oval-shaped SoftSeal/HushKit Combo™ (top, lower left) and the RWHS fit with the Oregon Aero custom, triangular-shaped SoftSeal/HushKit Combo™ (middle, lower right). The custom SoftSeal/HushKit Combo™ did not differ appreciably from the oval-shaped SoftSeal/HushKit Combo™. Insertion losses were increased over the HGU-84/P RWHS standard configuration at the low test frequency bands (below 300 Hz) but both test configurations performed poorer (i.e., had lower mean insertion losses) in the mid and high frequencies (from 300 Hz up to 8000 Hz). The caveat regarding tight versus normal helmet fitting procedures made above applies to these data as well.

Discussion

The replacement of the standard HGU-84/P RWHS earcup foam with the Oregon Aero HushKit™ replacement foam does not improve the noise attenuation of the helmet system when measured by ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear procedures. In fact, the insertion loss of the helmet with the HushKit™ installed is lower (less attenuation) than that measured in the standard helmet system when worn using normal-fitting procedures (as used in the fleet). Helmets fitted with the Oregon Aero SoftSeal™ replacement earcup seal and HushKit™ replacement foam and the SoftSeal/HushKit Combo™ replacement earcup perform marginally better than the standard HGU-84/P RWHS. If double hearing protection in the form of earplugs, the Communication Earplug (CEP), or Attenuating Custom Communications Earphone System for Aircrew (ACCES for Aircrew) are used, it is very unlikely that any of the Oregon Aero earcup replacement products would improve the hearing protection of the helmet system.

Note that the ANSI S12.42-1995 (R1999) standard used in the conduct of this evaluation is designed for quick, inexpensive, and repeatable measurements of hearing protective devices and not for the measurement of sound attenuation. ANSI S12.42 indicates that *“Neither the MIRE or Acoustic Test Fixture (ATF) procedure ... is intended to estimate sound attenuation or the level of hearing protection achieved in the work place.* This Standard is intended primarily for use in design, quality control assurance, and compliance with specifications for hearing protection devices. At or below 250 Hz, the MIRE attenuation values are often lower than real-ear values at threshold. (Paragraph 3). Before any replacement earcups are approved for flight, it is important that the sound attenuation of the helmet system with replacement components be evaluated in accordance with the appropriate method, in this case the real-ear attenuation at threshold measure described by ANSI S12.6-1997 (R2002). For military hearing protective systems, ANSI S12.6-1997 Method A, Experimenter-supervised fit, is preferred.

An second important caveat is in order. While it is possible that any replacement earcup seal or earcup may improve sound attenuation, it is essential that these products not be used until evaluations of helmet retention and the blunt impact protection provided by the helmet when fitted with these earcup replacement products are performed. It is possible that the surface of replacement earcup seals may slip during an aircraft mishap, allowing the helmet to rotate on the head and exposing normally-protected areas of the skull to blunt impacts. Likewise, aviation helmet earcups are often designed with energy-absorbing characteristics which might not be part of a replacement earcup design. Reduced energy absorption to lateral impacts will place aircrew wearing a modified helmet at a higher, unacceptable risk of head injury. Complete helmet retention and blunt impact tests under different environmental conditions are necessary before fielding any earcup replacement components.

VOLUNTEER AGREEMENT AFFIDAVIT

For use of this form, see AR 70-25 or AR 40-38; the proponent agency is OTSG.

PRIVACY ACT OF 1974

Authority: 10 USC 3013, 44 USC 3101, and 10 USC 1071-1087

Principal Purpose: To document voluntary participation in the Clinical Investigation and Research program. SSN and home address will be used for identification and locating purposes.

Routine Uses: The SSN and home address will be used for identification and locating purposes. Information derived from the study will be used to document the study; implementation of medical programs; adjudication of claims; and for the mandatory reporting of medical conditions as required by law. Information may be furnished to Federal, State, and local agencies.

Disclosure: The furnishing of your SSN and home address is mandatory and necessary to provide identification and to contact you if future information indicates that your health may be adversely affected. Failure to provide the information may preclude your voluntary participation in this investigational study.

PART A -- VOLUNTEER AFFIDAVIT

Volunteer Subjects in Approved Department of Army Research Studies

Volunteers under the provisions of AR 40-38 and AR 70-25 are authorized all necessary medical care for injury or diseases which is the proximate result of their participation in such studies.

I, _____ SSN _____,
having full capacity to consent and having attained my _____ birthday, do hereby
volunteer to participate in the research protocol, Sound Attenuation of the HGU-56/P Aircrew Integrated
Helmet System and HGU-84/P Rotary Wing Helmet System with the Oregon Aero HushKit™, SoftSeal™,
and Combo™

under the direction of William A. Ahroon, Ph.D.
conducted by the United States Army Aeromedical Research Laboratory, Fort Rucker, AL 36362-0577

The implications of my voluntary participation: duration and purpose of the research study; the methods and means by which it is to be conducted; and the inconveniences and hazards that may reasonably be expected have been explained to me by

Dr. William Ahroon, CPT Martin Robinette, Ms. Melinda Hill or Ms. Elmaree Gordon

I have been given an opportunity to ask questions concerning this investigational study. Any such questions were answered to my full and complete satisfaction. Should any further questions arise concerning my rights or study-related injury, I may contact

Dr. Patricia A. LeDuc

at Human Subject Review Committee, U.S. Army Aeromedical Research Laboratory,

Building 6901, P.O. Box 620577, Fort Rucker, Alabama 36362-0577 (334) 255-6872

I understand that I may at any time during the course of the study revoke my consent and withdraw from the study without further penalty or loss of benefits; however I may be required (military volunteer) or requested (civilian volunteer) to undergo certain examinations if, in the opinion of the attending physician, such examinations are necessary for my health and well-being. My refusal to participate will involve no penalty or loss of benefits to which I am otherwise entitled.

PART B -- TO BE COMPLETED BY INVESTIGATOR

INSTRUCTIONS FOR ELEMENTS OF INFORMED CONSENT: *(Provide a detailed explanation in accordance with Appendix C, AR 40-38 or AR 70-25.)*

You will be participating in a study to measure the sound attenuation of the HGU-56/P Aircrew Integrated Helmet System and HGU-84/P Rotary Wing Helmet System with alternative earcup configurations. All testing is performed in accordance with standards promulgated by the American National Standards Institute (ANSI).

To participate in some aspects of this study, you must have normal hearing relative to the definitions set by ANSI. You will be given a hearing test by a certified audiologist or hearing conservationist before your participation in the study. You also will complete a general health screening questionnaire which will include questions on your hearing. Following this introduction, you will be trained in the psychophysical procedure to be used in the evaluations of helmet.

The evaluation will be in two parts. The time required to complete all parts of the evaluation will be approximately 10 hours including training for the real-ear evaluation. (Approximately two hours for training and 90 minutes for each device tested.) Testing may be accomplished over several days.

Real-ear evaluation.—During the testing, you will be asked to adjust (using buttons on a control box) the loudness of a narrow band of noise (that sometimes may be like a “chirping” sound) so that the sound is just barely audible. When the sound is just barely audible, you will press the “SET” button and another trial will start. The number of trials for each stimulus type will depend on the stability of your responses. Seven different sounds will be used. At least five practice “audiograms” will be completed before actual data collection on any helmet configuration will begin. A total of four “audiograms” will be conducted for each device, alternating between devices in place and devices removed. For each condition, two measurements with the helmet on and two measurements with the helmet off will be made.

Microphone-in-Real-Ear evaluation.—You will be fitted with earplugs and a miniature microphone will be attached to the outer portion at the earplug. A brief, but loud, sound will be presented from which you will be protected by the earplugs. Next, you will don the helmet and the procedure will be repeated. You will don and doff the helmet three times.

No risk is anticipated for this study. Sounds presented in the real-ear evaluation (Part 1) are soft and present no risk. Noise exposures in the physical-ear evaluation (Part 2) are brief and are well within the allowable limits of 85 dBA L_{eq} for unprotected noise exposure set forth in DODI 6055.12 (1991). The earplugs worn during physical-ear evaluations provide an additional margin of protection from overexposure. Previous studies of this type have not resulted in any particular discomfort or ill effects to the subjects involved.

You will receive no personal benefit from participation in this study. Participation in this study is strictly voluntary, and you have the right to withdraw at any time without adverse consequences or loss of benefit.

The data from your participation in the study will be kept as confidential as possible. Representatives of the U.S. Army Medical Research and Materiel Command may inspect the records of this test and evaluation. Group data will be summarized in reports, but your name will never be identified with any specific data. None of the information obtained from this study which identifies you in any way will be released to a public forum without your express consent.

I have received a copy of this volunteer consent form and have read and fully understand its contents. I am signing this form voluntarily.

☐ I do ☐ do not (check one and initial) consent to the inclusion of this form in my
outpatient medical treatment record.

SIGNATURE OF VOLUNTEER

DATE

PERMANENT ADDRESS OF VOLUNTEER

TYPED NAME OF WITNESS

Appendix B.

General health screening questionnaire.

Volunteer Screening Questionnaire

Name _____ SSN: _____

Age: _____ DOB: _____ Height _____ Weight _____

General Health

Do you feel that you are currently in good health? NO YES

Do you have any medical waivers or profiles? NO YES

Have you ever had any problems with hearing? NO YES

Have you ever had any problems with balance, dizziness, motion sickness, ear pain or ear discharge? NO YES

Do you have any allergies? NO YES

Are you currently suffering from any illnesses? NO YES

Have you taken any medication within the past three days? NO YES

Following to be completed by audiologist or audiometric technician only

Earcanal Size: _____ Bitrignon width: _____ mm. Head height: _____ mm

Audiometric Screening

Frequency 125 250 500 1000 2000 4000 8000

Pre-test _____ _____ _____ _____ _____ _____ _____

Audiologist/CAOHC Tech Signature & Date

Following to be completed by aeromedical monitor only

Anatomical Features	GO	NO-GO	Reason for disqualification:
Otosopic Inspection	GO	NO-GO	
Pretest Audiogram	GO	NO-GO	

Principal Investigator's Signature & Date

Medical Monitor's Signature & Date

Appendix C.

Microphone-in-Real-Ear raw data for all subjects.

Tables C-1 – C-10	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System using normal-fitting instructions.
Tables C-11 – C-20	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero HushKit™ using normal-fitting instructions.
Tables C-21 – C-30	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero SoftSeal™ and HushKit™ using normal-fitting instructions.
Tables C-31 – C-40	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero SoftSeal/HushKit Combo™ using normal-fitting instructions.
Tables C-41 – C-50	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System using tight-fitting instructions.
Tables C-51 – C-60	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero HushKit™ using tight-fitting instructions.
Tables C-61 – C-70	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero SoftSeal™ and HushKit™ using tight-fitting instructions.
Tables C-71 – C-80	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero SoftSeal/HushKit Combo™ using tight-fitting instructions.
Tables C-81 – C-90	Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero SoftSeal™ using tight-fitting instructions.

Tables C-91 – C-100 Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System with Oregon Aero custom SoftSeal/HushKit Combo™ using tight-fitting instructions.

Table C-1. Raw data for ANSI S12.42-1995 (R1999) Microphone-in-Real-Ear evaluations of the HGU-84/P Rotary Wing Helmet System using normal-fitting instructions – Subject 1.
